

# AssayMax<sup>™</sup> Human Livin ELISA Kit

Assaypro LLC 3400 Harry S Truman Blvd St. Charles, MO 63301 T (636) 447-9175 F (636) 395-7419 www.assaypro.com

For any questions regarding troubleshooting or performing the assay, please contact our support team at support@assaypro.com.

### **Assay Summary**

**Step 1**. Add 50  $\mu$ l of Standard or Sample per well. Incubate 2 hours.

**Step 2.** Wash, then add 50  $\mu$ l of Biotinylated Antibody per well. Incubate 1 hour.

**Step 3**. Wash, then add 50  $\mu$ l of SP Conjugate per well. Incubate 30 minutes.

**Step 4.** Wash, then add 50  $\mu$ l of Chromogen Substrate per well. Incubate 20 minutes.

Step 5. Add 50  $\mu$ l of Stop Solution per well. Read at 450 nm immediately.

### **Symbol Key**

Consult instructions for use.

### **Human Livin (BIRC7) ELISA Kit**

Catalog No. EL3205-1

Sample insert for reference use only

#### Introduction

Livin, also known as baculoviral IAP repeat-containing protein 7 (BIRC7), kidney inhibitor of apoptosis protein (KIAP), melanoma inhibitor of apoptosis protein (ML-IAP), and RING finger protein 50, is a member of the inhibitor of apoptosis protein (IAP) family. Livin contains a single copy of a baculovirus IAP repeat (BIR) as well as a RING-type zinc finger domain. The BIR domain is essential for anti-apoptotic activity and interacts with caspases, while the RING finger domain sometimes enhances antiapoptotic activity but does not inhibit apoptosis alone (1-3). Two isoforms alpha (298 amino acids) and beta (280 amino acids) have been found. Isoform alpha blocks staurosporine-induced apoptosis and isoform beta blocks etoposide-induced apoptosis. Livin may play a complex role in the regulation of apoptosis (4).

#### Principle of the Assay

The AssayMax Human Livin (BIRC7) ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for detection of human livin in plasma, serum, and cell culture samples. This assay employs a quantitative sandwich enzyme immunoassay technique that measures human livin in less than 4 hours. A polyclonal antibody specific for human livin has been pre-coated onto a 96-well microplate with removable strips. Livin in standards and samples is sandwiched by the immobilized antibody and the biotinylated polyclonal antibody specific for livin, which is recognized by a streptavidin-peroxidase conjugate. All unbound material is washed away and a peroxidase enzyme substrate is added. The color development is stopped and the intensity of the color is measured.

### **Caution and Warning**

- This product is for Research Use Only and is not intended for use in diagnostic procedures.
- Prepare all reagents (working diluent buffer, wash buffer, standard, biotinylated antibody, and SP conjugate) as instructed, prior to running the assay.
- Prepare all samples prior to running the assay. The dilution factors for the samples are suggested in this insert. However, the user should determine the optimal dilution factor.

- Spin down the SP conjugate vial and the biotinylated antibody vial before opening and using contents.
- The Stop Solution is an acidic solution.
- The kit should not be used beyond the expiration date.

#### Reagents

- Human Livin Microplate: A 96-well polystyrene microplate (12 strips of 8 wells) coated with a polyclonal antibody against human livin.
- Sealing Tapes: Each kit contains 3 precut, pressure sensitive sealing tapes that can be cut to fit the format of the individual assay.
- Human Livin Standard: Human livin in a buffered protein base (50 ng, lyophilized).
- **Biotinylated Human Livin Antibody (60x):** A 60-fold concentrated biotinylated polyclonal antibody against livin (100 μl).
- **EIA Diluent Concentrate (10x):** A 10-fold concentrated buffered protein base (20 ml).
- Wash Buffer Concentrate (20x): A 20-fold concentrated buffered surfactant (30 ml, 2 bottles).
- Streptavidin-Peroxidase Conjugate (SP Conjugate): A 100-fold concentrate (80 μl).
- Chromogen Substrate: A ready-to-use stabilized peroxidase chromogen substrate tetramethylbenzidine (8 ml).
- Stop Solution: A 0.5 N hydrochloric acid to stop the chromogen substrate reaction (12 ml).

#### **Storage Condition**

- Upon arrival, immediately store components of the kit at recommended temperatures up to the expiration date.
- Store SP Conjugate and Biotinylated Antibody at -20°C.
- Store Microplate, Diluent Concentrate (10x), Wash Buffer, Stop Solution, and Chromogen Substrate at 2-8°C.
- Unused microplate wells may be returned to the foil pouch with the desiccant packs and resealed. May be stored for up to 30 days in a vacuum desiccator.
- Diluent (1x) may be stored for up to 30 days at 2-8°C.
- Store Standard at 2-8°C before reconstituting with Diluent and at -20°C after reconstituting with Diluent.

### **Other Supplies Required**

- Microplate reader capable of measuring absorbance at 450 nm.
- Pipettes (1-20 μl, 20-200 μl, 200-1000 μl, and multiple channel).

Deionized or distilled reagent grade water.

#### Sample Collection, Preparation, and Storage

- Plasma: Collect plasma using one-tenth volume of 0.1 M sodium citrate
  as an anticoagulant. Centrifuge samples at 3000 x g for 10 minutes, and
  assay. The undiluted samples can be stored at -20°C or below for up to 3
  months. Avoid repeated freeze-thaw cycles (EDTA or Heparin can also be
  used as anticoagulant).
- **Serum:** Samples should be collected into a serum separator tube. After clot formation, centrifuge samples at 3000 x g for 10 minutes, remove serum, and assay. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.
- Cell Culture Supernatants: Centrifuge cell culture media at 3000 x g for 10 minutes to remove debris. Collect supernatants and assay. Store the remaining samples at -20°C or below. Avoid repeated freeze-thaw cycles.

#### **Reagent Preparation**

- Freshly dilute all reagents and bring all reagents to room temperature before use.
- EIA Diluent Concentrate (10x): If crystals have formed in the concentrate, mix gently until the crystals have completely dissolved.
   Dilute the EIA Diluent Concentrate 1:10 with reagent grade water. Store for up to 30 days at 2-8°C.
- Standard Curve: Reconstitute the 50 ng of Human Livin Standard with 1 ml of EIA Diluent to generate a 50 ng/ml standard stock solution. Allow the standard to sit for 10 minutes with gentle agitation prior to making dilutions. Prepare duplicate or triplicate standard points by serially diluting the standard stock solution (50 ng/ml) 1:2 with EIA Diluent to produce 25, 12.5, 6.25, 3.125, 1.563, and 0.781 ng/ml solutions. EIA Diluent serves as the zero standard (0 ng/ml). Aliquot standard to limit repeated freezing and thawing. Any remaining solution in the aliquot tube should be frozen at -20°C and used within 3 days. Avoid repeated freeze-thaw cycles.

| Standard Point | Dilution                       | [Livin] (ng/ml) |
|----------------|--------------------------------|-----------------|
| P1             | 1 part Standard (50 ng/ml)     | 50.0            |
| P2             | 1 part P1 + 1 part EIA Diluent | 25.0            |
| P3             | 1 part P2 + 1 part EIA Diluent | 12.5            |
| P4             | 1 part P3 + 1 part EIA Diluent | 6.25            |
| P5             | 1 part P4 + 1 part EIA Diluent | 3.125           |
| P6             | 1 part P5 + 1 part EIA Diluent | 1.563           |
| P7             | 1 part P6 + 1 part EIA Diluent | 0.781           |
| P8             | EIA Diluent                    | 0.000           |

- Biotinylated Human Livin Antibody (60x): Spin down the antibody briefly and dilute the desired amount of the antibody 1:60 with EIA Diluent. Any remaining solution should be frozen at -20°C.
- Wash Buffer Concentrate (20x): If crystals have formed in the concentrate, mix gently until the crystals have completely dissolved.
   Dilute the Wash Buffer Concentrate 1:20 with reagent grade water.
- SP Conjugate (100x): Spin down the SP Conjugate briefly and dilute the desired amount of the conjugate 1:100 with EIA Diluent. Any remaining solution should be frozen at -20°C.

#### **Assay Procedure**

- Prepare all reagents, standard solutions, and samples as instructed. Bring all reagents to room temperature before use. The assay is performed at room temperature (20-25°C).
- Remove excess microplate strips from the plate frame and return them
  immediately to the foil pouch with desiccants inside. Reseal the pouch
  securely to minimize exposure to water vapor and store in a vacuum
  desiccator.
- Add 50 µl of Human Livin Standard or sample per well. Cover wells with a sealing tape and incubate for 2 hours. Start the timer after the last addition.
- Wash five times with 200  $\mu$ l of Wash Buffer manually. Invert the plate each time and decant the contents; hit 4-5 times on absorbent material to completely remove the liquid. If using a machine, wash six times with 300  $\mu$ l of Wash Buffer and then invert the plate, decanting the contents; hit 4-5 times on absorbent material to completely remove the liquid.
- Add 50 µl of Biotinylated Human Livin Antibody to each well and incubate for 1 hour.
- Wash the microplate as described above.
- Add 50 µl of Streptavidin-Peroxidase Conjugate to each well and incubate for 30 minutes. Turn on the microplate reader and set up the program in advance.
- Wash the microplate as described above.

- Add 50 µl of Chromogen Substrate per well and incubate for 20 minutes or till the optimal blue color density develops. Gently tap plate to ensure thorough mixing and break the bubbles in the well with pipette tip.
- $\bullet \quad$  Add 50  $\mu l$  of Stop Solution to each well. The color will change from blue to yellow.
- Read the absorbance on a microplate reader at a wavelength of 450 nm immediately. If wavelength correction is available, subtract readings at 570 nm from those at 450 nm to correct optical imperfections. Otherwise, read the plate at 450 nm only. Please note that some unstable black particles may be generated at high concentration points after stopping the reaction for about 10 minutes, which will reduce the readings.

#### **Data Analysis**

- Calculate the mean value of the duplicate or triplicate readings for each standard and sample.
- To generate a standard curve, plot the graph using the standard concentrations on the x-axis and the corresponding mean 450 nm absorbance (OD) on the y-axis. The best-fit line can be determined by regression analysis using log-log or four-parameter logistic curve-fit.
- Determine the unknown sample concentration from the Standard Curve and multiply the value by the dilution factor.

### **Typical Data**

 The typical data is provided for reference only. Individual laboratory means may vary from the values listed. Variations between laboratories may be caused by technique differences.

| Standard Point       | ng/ml | Average OD |
|----------------------|-------|------------|
| P1                   | 50.0  | 1.757      |
| P2                   | 25.0  | 1.126      |
| P3                   | 12.5  | 0.720      |
| P4                   | 6.25  | 0.486      |
| P5                   | 3.125 | 0.318      |
| P6                   | 1.563 | 0.221      |
| P7                   | 0.781 | 0.198      |
| P8                   | 0.000 | 0.102      |
| Sample: Normal, Sodi | 0.235 |            |

#### **Standard Curve**

• The curve is provided for illustration only. A standard curve should be generated each time the assay is performed.

Human Livin Standard Curve

#### **Performance Characteristics**

- The minimum detectable dose of livin as calculated by 2SD from the mean of a zero standard was established to be 0.7 ng/ml.
- Intra-assay precision was determined by testing replicates of three plasma samples in one assay.
- Inter-assay precision was determined by testing three plasma samples in twenty assays.

|                   | Intra-Assay Precision |      |      | Inter | -Assay Prec | ision |
|-------------------|-----------------------|------|------|-------|-------------|-------|
| Sample            | 1                     | 2    | 3    | 1     | 2           | 3     |
| n                 | 20                    | 20   | 20   | 20    | 20          | 20    |
