ELISA Kits, Antibodies,  
Deficient Plasma and Serum,  
and Purified Proteins for  
Therapeutic Drug Discovery

Coagulation is the body's natural process for preventing blood loss through the formation of stable clots following vascular injury. When this tightly regulated system becomes imbalanced, thrombosis can occur, leading to the formation of unwanted clots within blood vessels. These thrombi may obstruct blood flow or embolize, causing serious conditions such as myocardial infarction, stroke, and pulmonary embolism. Thrombotic events play a central role in cardiovascular diseases (CVDs), including coronary artery disease, peripheral artery disease, and cerebrovascular disorders. Often triggered by atherosclerotic plaque rupture, these conditions remain a leading cause of morbidity and mortality worldwide.

Assaypro provides a wide range of products to support the drug discovery research. Our product line includes ELISA kits, antibodies, deficient plasma and serum, and purified proteins.
